

Dnspython 2.6.0rc1 dns.query.udp() API change heads-up #913

Closed

rthalley opened on Feb 10, 2024

As part of addressing a potential resolution DoS, we had to add a new parameter to `dns.query.udp()`, "ignore_errors". Dnspython's stub resolver in 2.6.0 will pass `True` for this flag, so the monkeypatched version of `dns.query.udp()` in eventlet will need to be updated or resolutions will start failing when people install dnspython 2.6.0. I just released 2.6.0rc1, and will release the final version a week from now, so you can test with that. If you just fix the API, then you will be vulnerable to the potential DoS still, as the fix involves ignoring various errors in the receive loop instead of giving up. You can see the revised logic in dnspython's `dns.query.receive_udp()` method. Pinning eventlet to <2.6.0 would also be a mitigation, though again with the potential DoS.

@kelvin-j-li Will release a new eventlet version once your patch is merged, but please answer my question first => [#916 \(comment\)](#)

Dnspython 2.6.0 is live now. I have put up a "pinned" dnspython issue telling people using eventlet and dnspython that the eventlet team is working on a patch and to pin dnspython to < 2.6 in the meantime.

rthalley on Feb 19, 2024

Author ...

I had to do a 2.6.1 because the Tudoor CVE fix ate a legitimate Truncated exception too. I updated the sample eventlet code referred to above to include this change. Sorry about the froth!
