► Boilerplate: yt-dlp/own code, fix

Description of your pull request and other information

This PR adds validation of file extensions processed by yt-dl

- against a white-list of expected extensions (unpublicised `--no-check-extensions` disables this, CLI only)
- to exclude path separators in a site-supplied extension that could enable path traversal under vulnerable OSes (Windows, eg).

The PR is derived from <https://github.com/yt-dlp/yt-dlp-ghsa-79w7-vh3h-8g4j/pull/1>.

Thanks:

- @Grub4K for the PR
- @pukkandan for the original report
- @JarLob for a further report and for additional testing.

eyaler commented [on Jul 6, 2024](#)

[@dirkf](#) saving a video file without an extension is a practice which may be used for having a format-agnostic filename. this change breaks multiple scripts with this behavior. please consider reverting the behavior to allow no extension

Please open a support issue showing an example with verbose log and explaining what you think should happen instead.

Possible work-arounds for CLI:

- use `--exec ...` to rename away an unwanted extension
- use `--no-check-extensions`

For API, try similar approaches to that in [e15101c](#)

(`__init__.py`) or the equivalent in *yt-dlp*

```
( _UnsafeExtensionError.sanitize_extension = lambda  
x, **kw: x ).
```
